

Semantic Analysis

TEACHING ASSISTANT: DAVID TRABISH

Semantic Analysis

Perform various checks:

- Type checking
 - $1 + \text{"1"}$
- Scopes
 - Undefined variables
- Other
 - Division by zero
 - Visibility semantics in classes (public, private, ...)

Visitor Design Pattern

Perform computations over tree-like data structures

visit(node):

// do something with node

$r_1 = \text{visit}(\text{node.child}_1)$

$r_2 = \text{visit}(\text{node.child}_2)$

...

// do something with r_1, r_2, \dots

Visitor Design Pattern: Example

Printing the AST

```
visit(node):  
    print(node)  
    for child in node.children:  
        visit(child)
```

Symbol Table

- Stack of scopes
- Each scope contains information about identifiers
 - Name
 - Type (int, string, ...)
 - Kind (variable, function, method, ...)

Symbol Table

Symbol Table Operations

- **Insert** symbol
- **Lookup** symbol
- **Enter** scope
- **Exit** scope

Symbol Table: Insert

Example:

- Insert(z, int, variable)

main scope

ID	Type	Kind
x	int	variable
y	int	variable

scope₁

ID	Type	Kind
tmp	int	variable

scope₂

Symbol Table: Insert

Example:

- Insert(z, int, variable)

main scope

ID	Type	Kind
x	int	variable
y	int	variable

scope₁

ID	Type	Kind
tmp	int	variable
z	Int	variable

scope₂

Symbol Table: Lookup

Example:

- Lookup(y)
 - Start from the top of the stack, return **first** match

main scope

Symbol Table: Lookup

Example:

- Lookup(y)
 - Start from the top of the stack, return **first** match

main scope

Symbol Table: Enter

main scope

ID	Type	Kind
x	int	variable
y	int	variable

scope₁

ID	Type	Kind
tmp	int	variable

scope₂

Symbol Table: Enter

main scope

ID	Type	Kind
x	int	variable
y	int	variable

$scope_1$

ID	Type	Kind
tmp	int	variable

$scope_2$

ID	Type	Kind

$scope_3$

Symbol Table: Exit

main scope

ID	Type	Kind
x	int	variable
y	int	variable

scope₁

ID	Type	Kind
tmp	int	variable

scope₂

Symbol Table: Exit

main scope

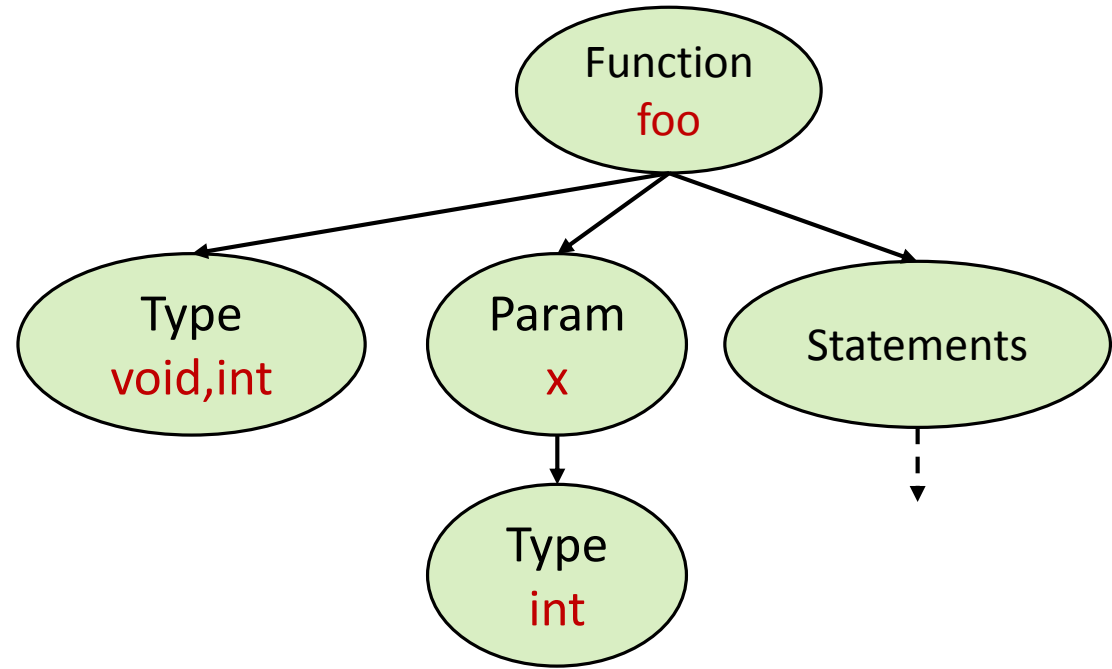

ID	Type	Kind
x	int	variable
y	int	variable

scope₁

Symbol Table Construction

- Identifier declaration
 - Insert
- Identifier reference
 - Lookup
- When visiting a new block
 - Enter
- When leaving a block
 - Exit

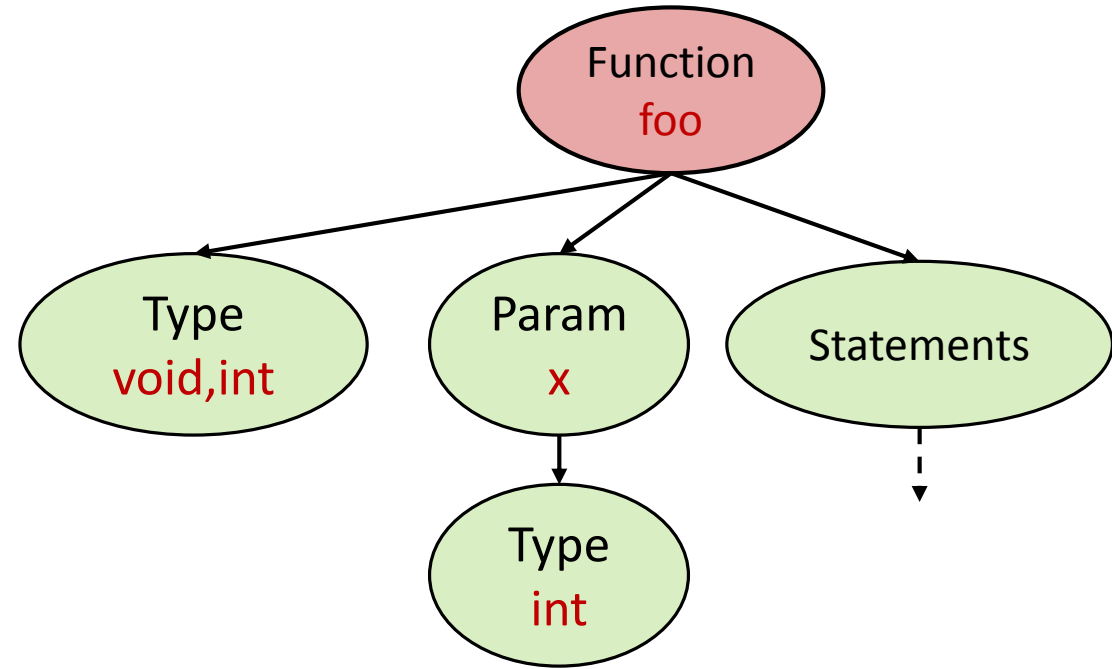

```
void foo(int x) {  
    int a = 1;  
    int b = 2;  
    if (x) {  
        string a = "abc";  
    }  
}
```

```
void foo(int x) {  
    int a = 1;  
    int b = 2;  
    if (x) {  
        string a = "abc";  
    }  
}
```

ID	Type	Kind
foo	void,int	function

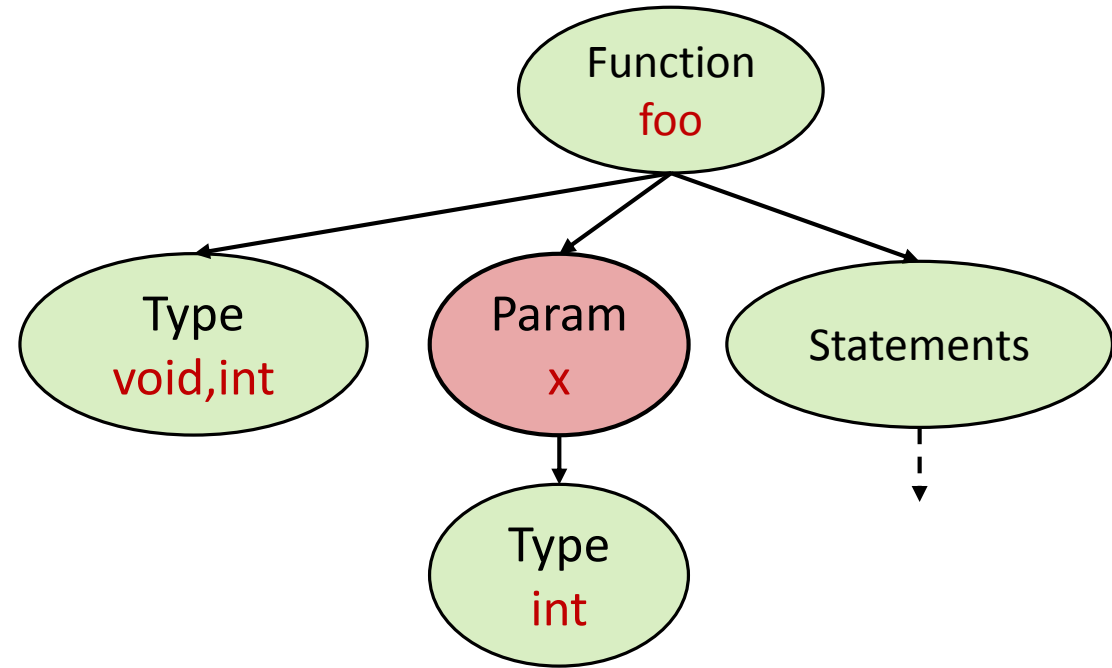

```
void foo(int x) {  
    int a = 1;  
    int b = 2;  
    if (x) {  
        string a = "abc";  
    }  
}
```

ID	Type	Kind
foo	void,int	function

ID	Type	Kind

```
void foo(int x) {  
    int a = 1;  
    int b = 2;  
    if (x) {  
        string a = "abc";  
    }  
}
```

ID	Type	Kind
foo	void,int	function

ID	Type	Kind
x	int	variable

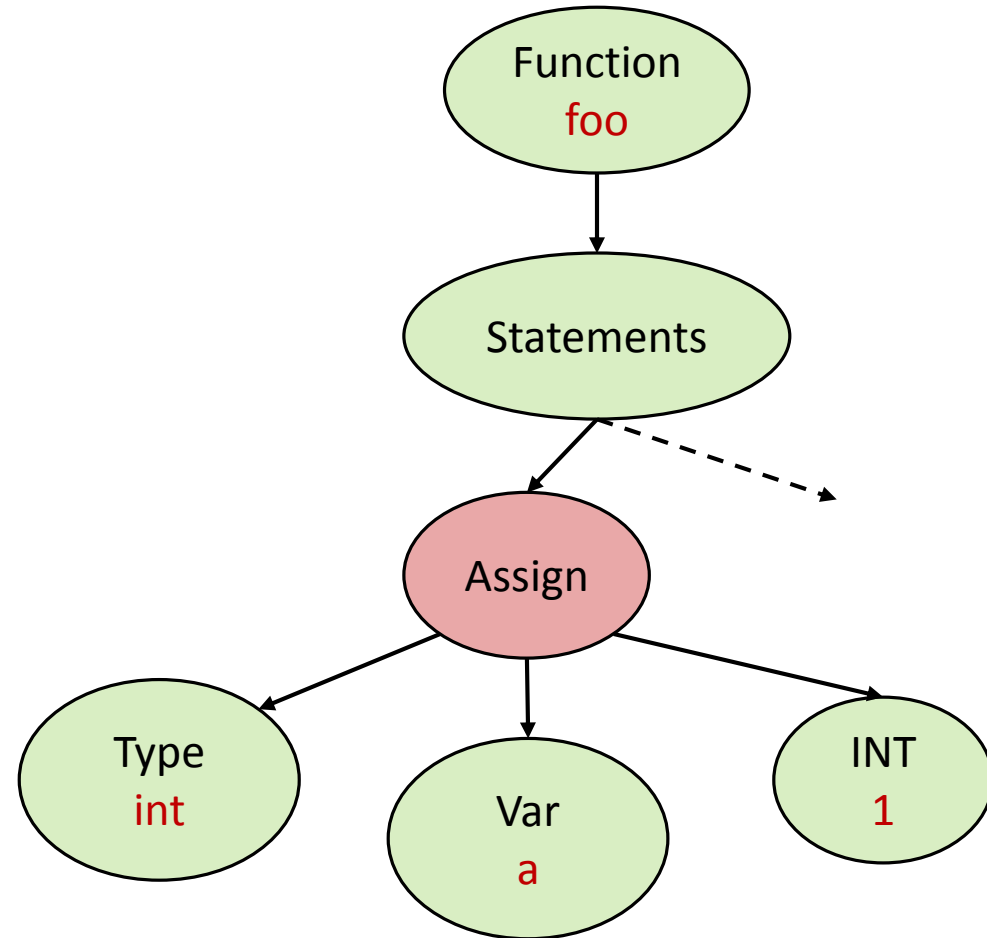

```
void foo(int x) {  
    int a = 1;  
    int b = 2;  
    if (x) {  
        string a = "abc";  
    }  
}
```

ID	Type	Kind
foo	void,int	function

ID	Type	Kind
x	int	variable
a	int	variable

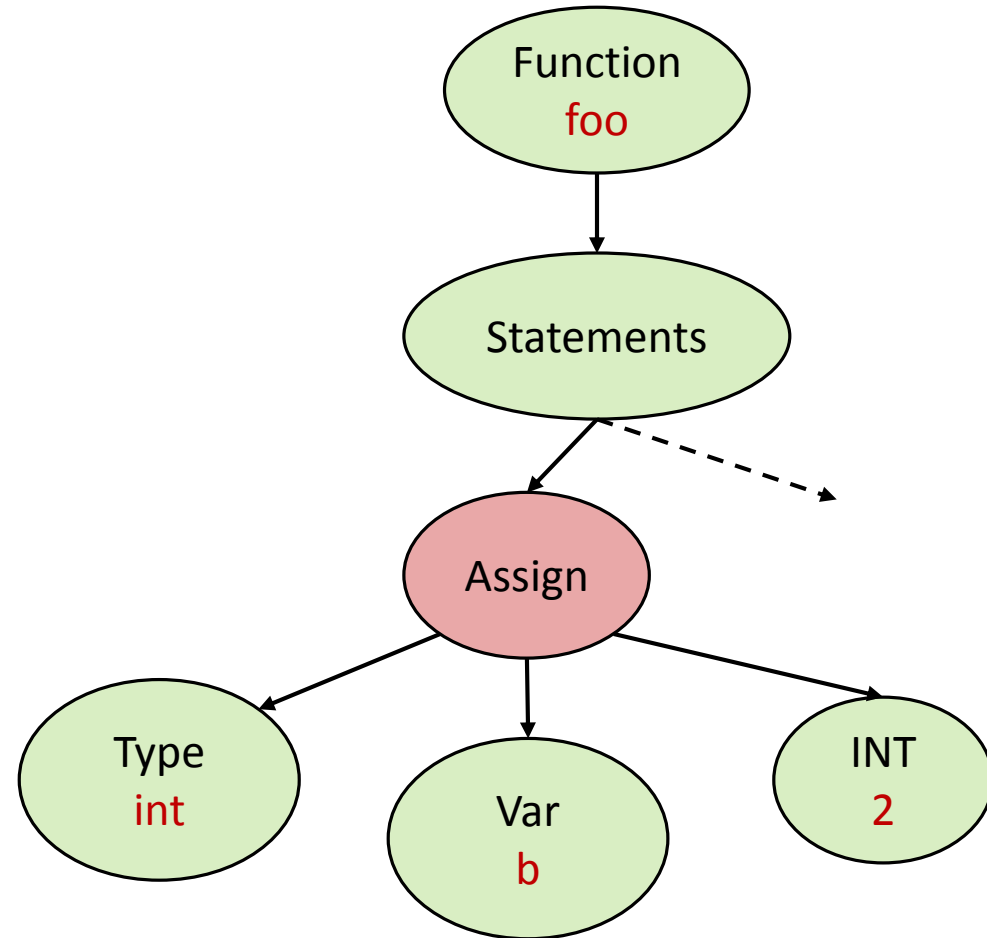

```
void foo(int x) {  
    int a = 1;  
    int b = 2;  
    if (x) {  
        string a = "abc";  
    }  
}
```

ID	Type	Kind
foo	void,int	function

ID	Type	Kind
x	int	variable
a	int	variable
b	int	variable

```
void foo(int x) {  
    int a = 1;  
    int b = 2;  
    if (x) {  
        string a = "abc";  
    }  
}
```

ID	Type	Kind
foo	void,int	function

ID	Type	Kind
x	int	variable
a	int	variable
b	int	variable

ID	Type	Kind

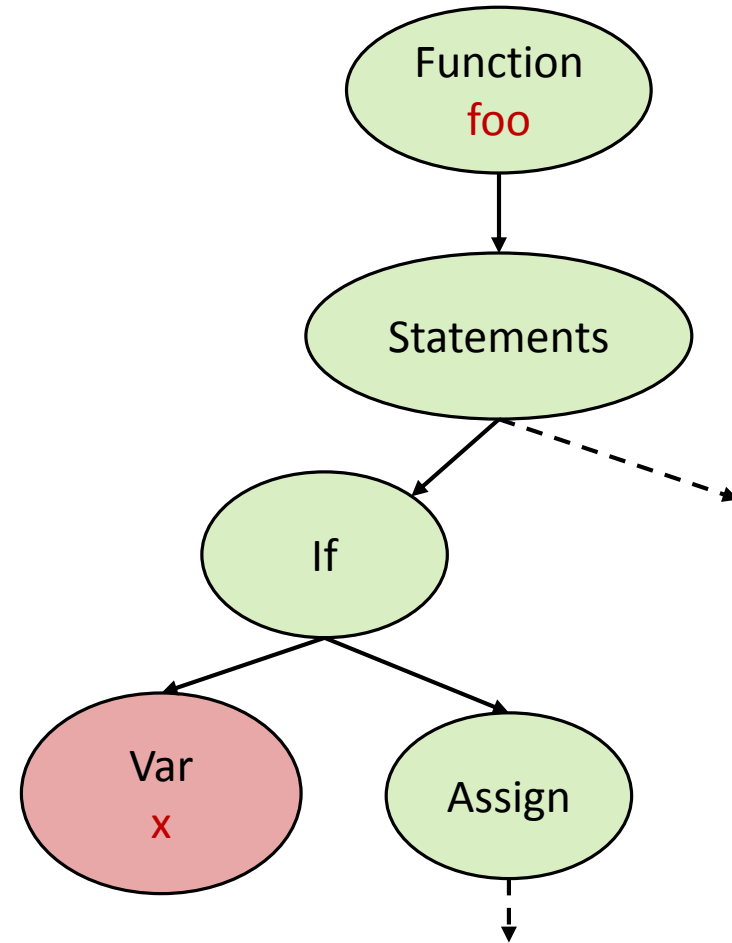

```
void foo(int x) {  
    int a = 1;  
    int b = 2;  
    if (x) {  
        string a = "abc";  
    }  
}
```

ID	Type	Kind
foo	void,int	function

ID	Type	Kind
x	int	variable
a	int	variable
b	int	variable

ID	Type	Kind

```
void foo(int x) {  
    int a = 1;  
    int b = 2;  
    if (x) {  
        string a = "abc";  
    }  
}
```

ID	Type	Kind
foo	void,int	function

ID	Type	Kind
x	int	variable
a	int	variable
b	int	variable

ID	Type	Kind
a	string	variable

```

void foo(int x) {
    int a = 1;
    int b = 2;
    if (x) {
        string a = "abc";
    }
}

```

ID	Type	Kind
foo	void,int	function

ID	Type	Kind
x	int	variable
a	int	variable
b	int	variable

```
void foo(int x) {  
    int a = 1;  
    int b = 2;  
    if (x) {  
        string a = "abc";  
    }  
}
```

ID	Type	Kind
foo	void,int	function

```
void foo(int x) {  
    int a = 1;  
    int b = 2;  
    if (x) {  
        string a = "abc";  
    }  
}
```

Type Checking

Goals:

- Type correctness of expressions
- Compute type of expressions

Performed using:

- AST visitor
- Symbol table

Type Checking

Basic algorithm:

visit(node):

$t_1 = \text{visit}(\text{node.child}_1)$

...

$t_n = \text{visit}(\text{node.child}_n)$

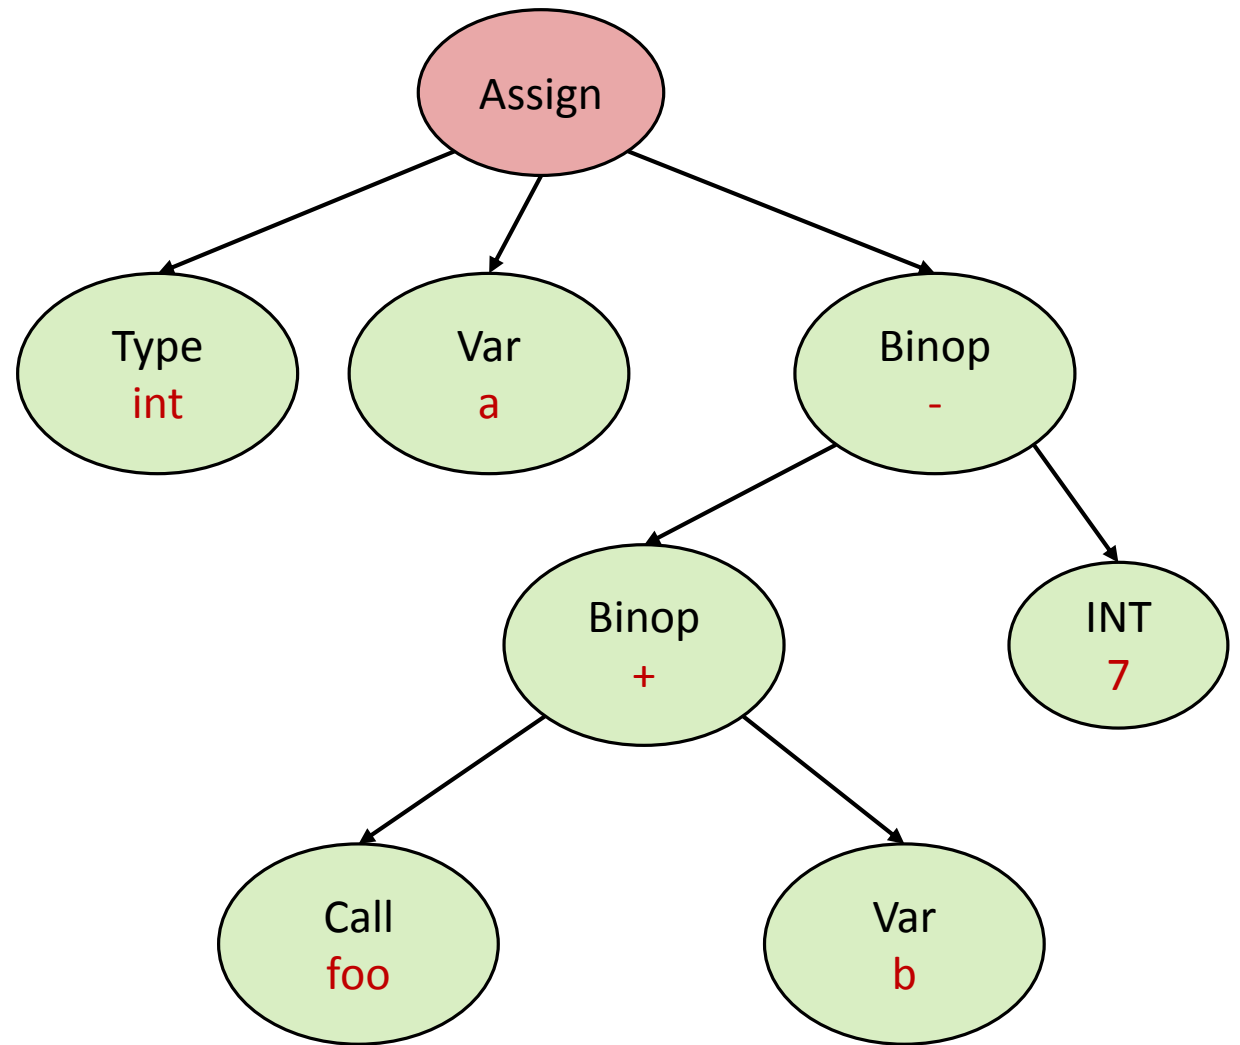

$\text{return } \underbrace{\text{compute_type}(t_1, \dots, t_n)}_{\text{node specific}}$

```
int a = foo() + b - 7;  
...
```

ID	Type	Kind
foo	int,void	function

ID	Type	Kind
b	int	variable

```
int a = foo() + b - 7;  
...
```

ID	Type	Kind
foo	int,void	function

ID	Type	Kind
b	int	variable

```
int a = foo() + b - 7;  
...
```

ID	Type	Kind
foo	int,void	function

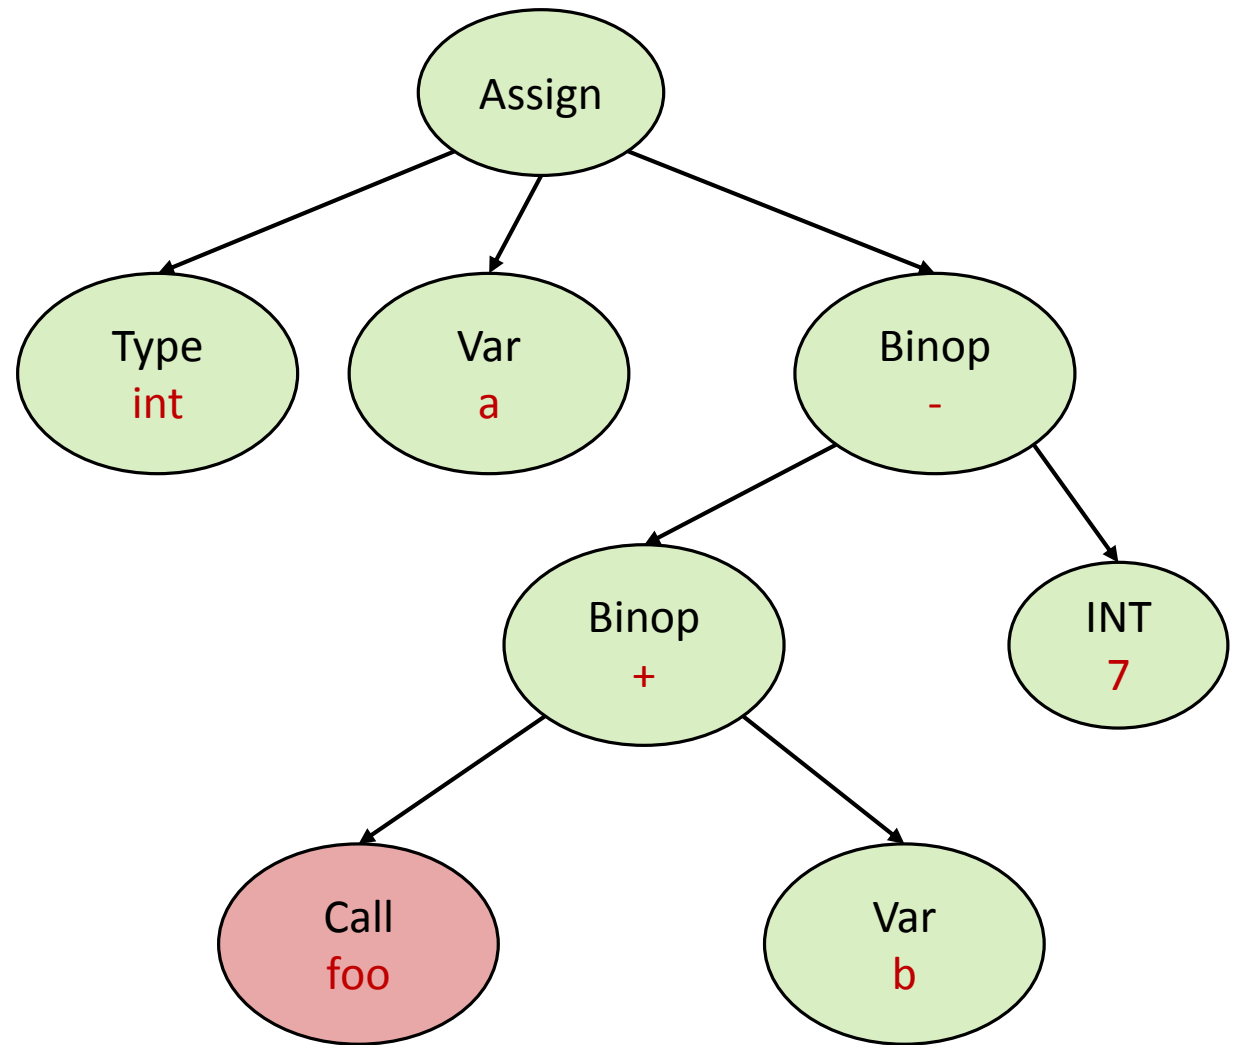

ID	Type	Kind
b	int	variable

```
int a = foo() + b - 7;  
...
```

ID	Type	Kind
foo	int,void	function

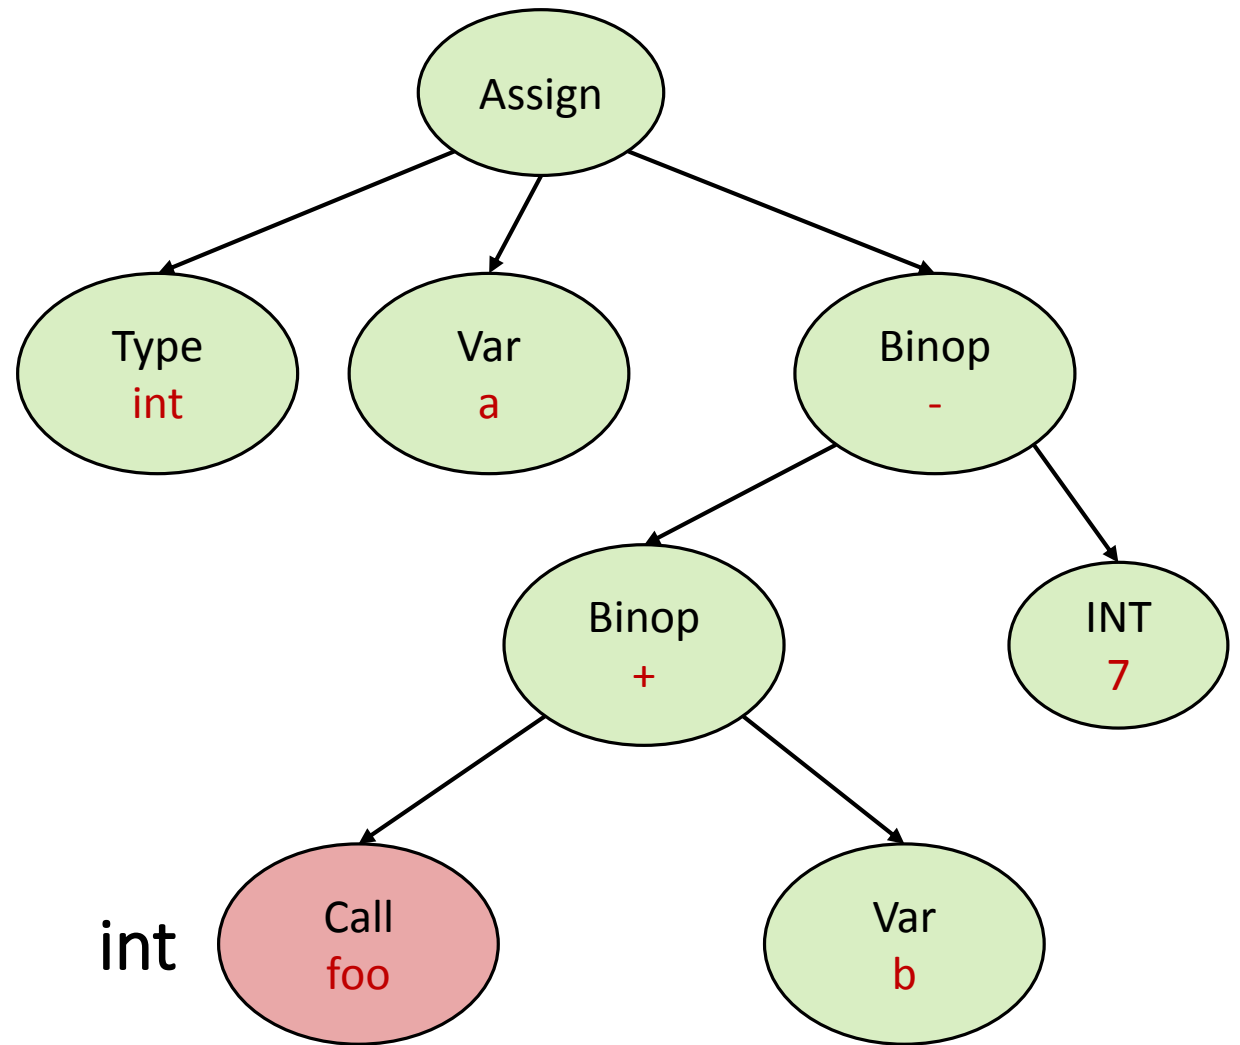

ID	Type	Kind
b	int	variable

```
int a = foo() + b - 7;  
...
```

ID	Type	Kind
foo	int,void	function

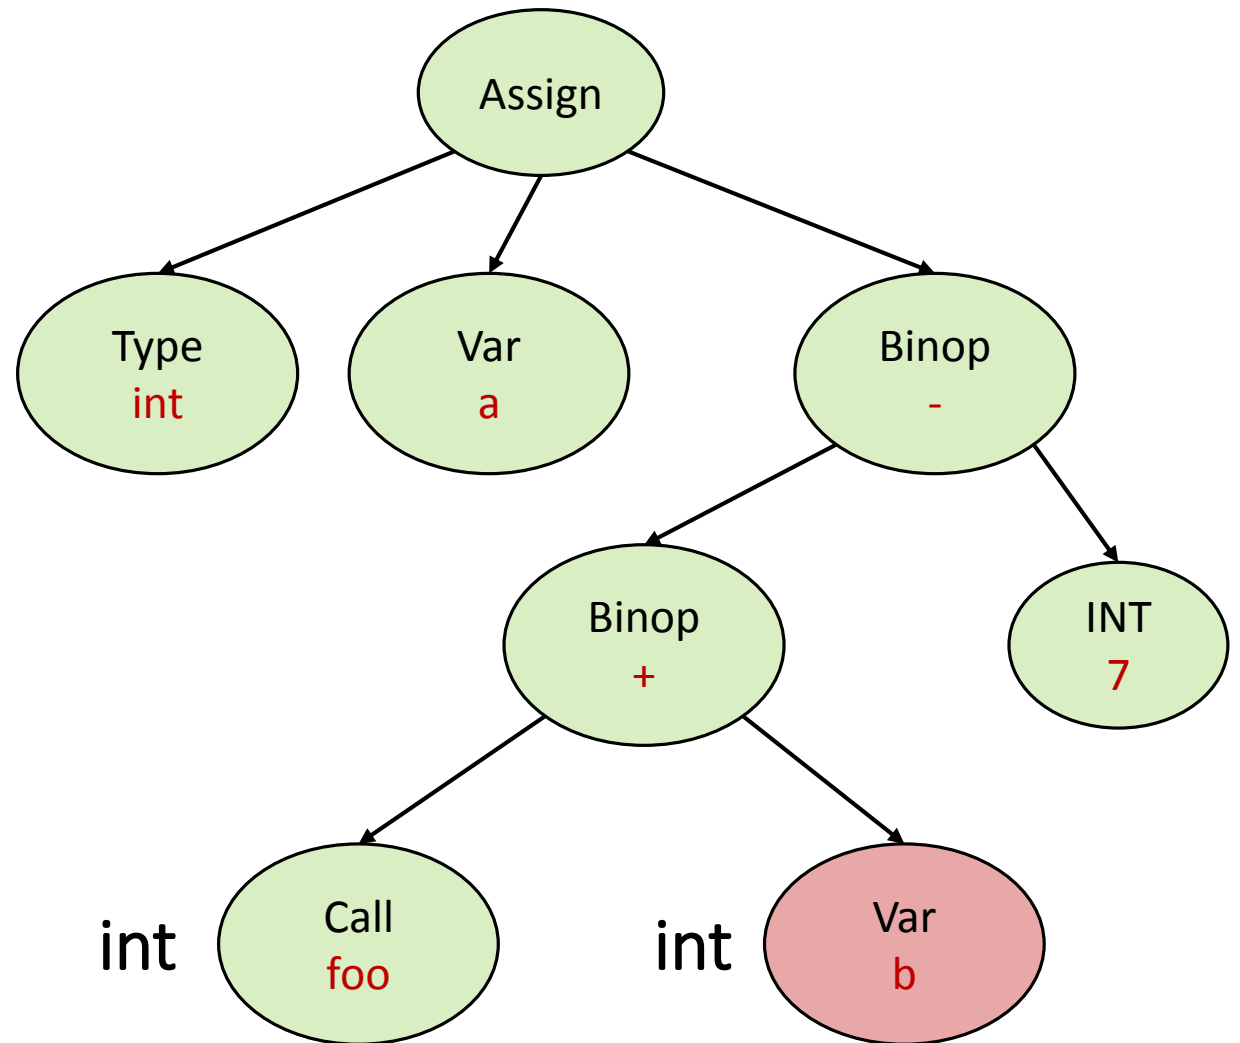

ID	Type	Kind
b	int	variable

```
int a = foo() + b - 7;  
...
```

ID	Type	Kind
foo	int,void	function

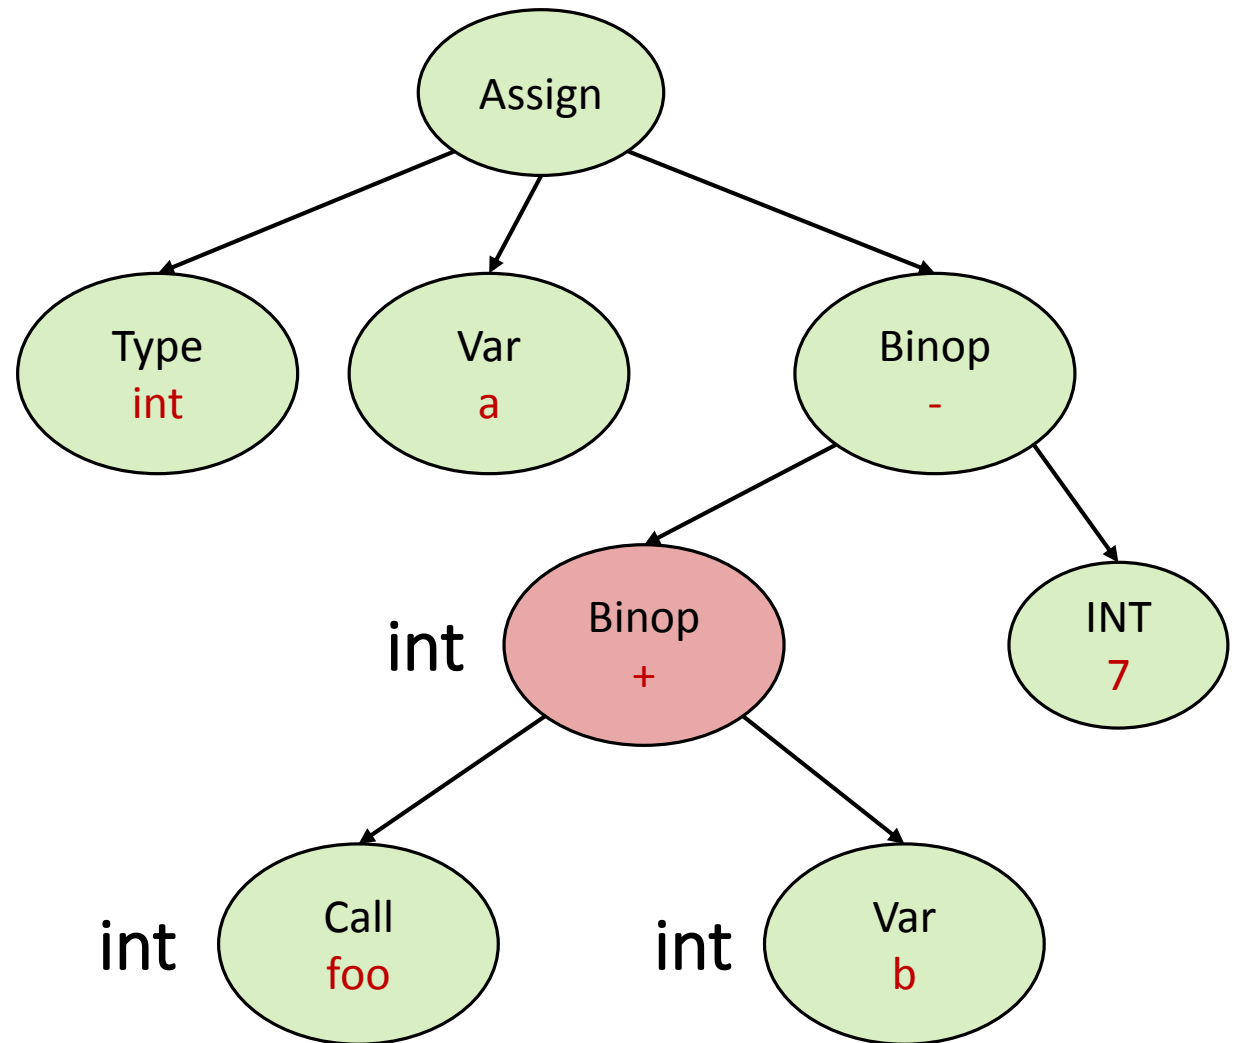

ID	Type	Kind
b	int	variable

```
int a = foo() + b - 7;  
...
```

ID	Type	Kind
foo	int,void	function

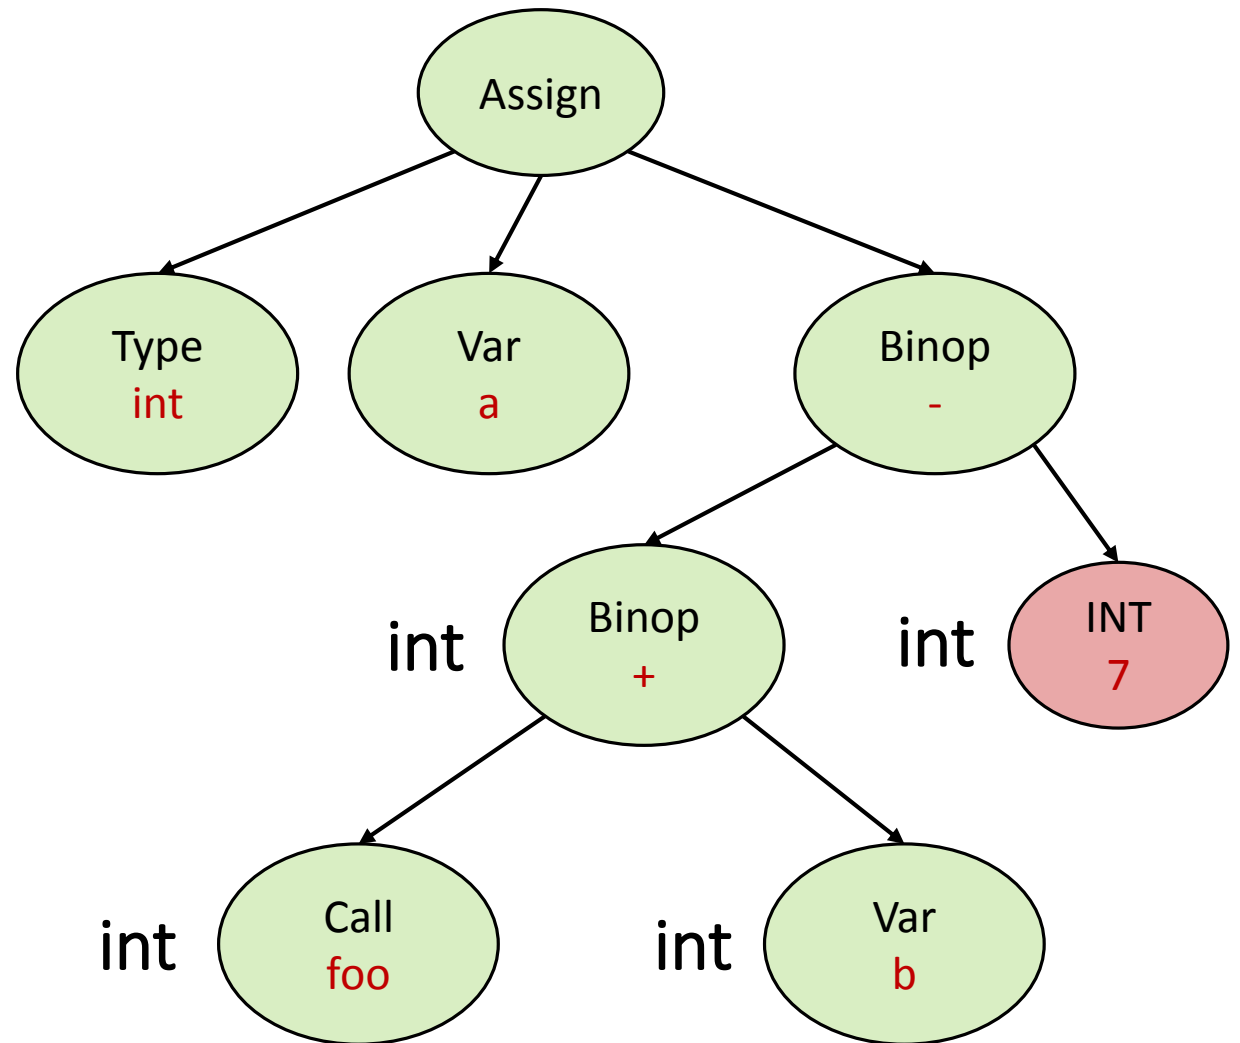

ID	Type	Kind
b	int	variable

```
int a = foo() + b - 7;  
...
```

ID	Type	Kind
foo	int,void	function

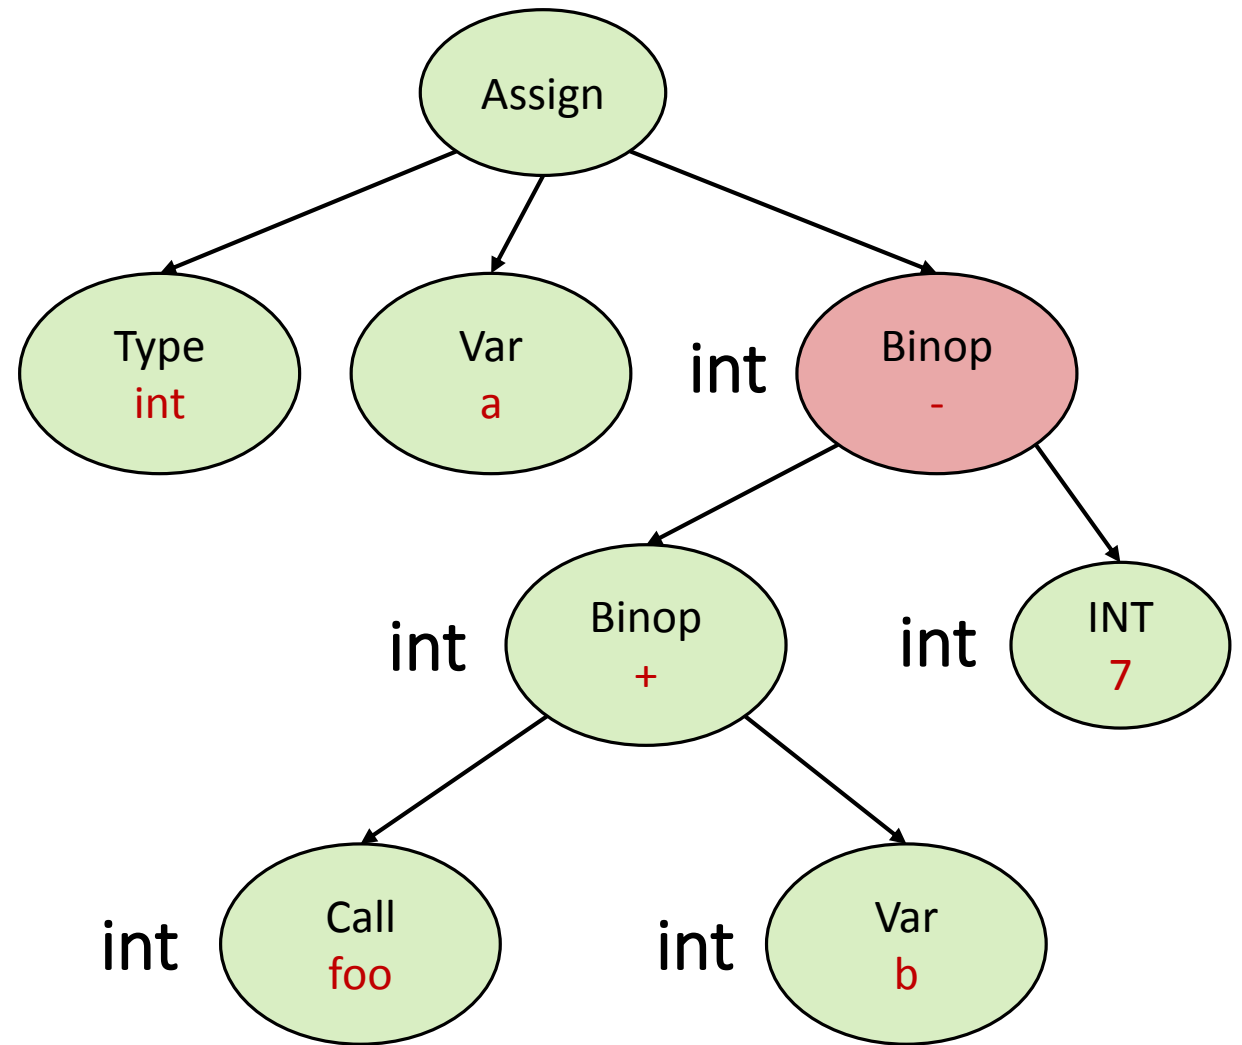

ID	Type	Kind
b	int	variable

```
int a = foo() + b - 7;  
...
```

ID	Type	Kind
foo	int,void	function

ID	Type	Kind
b	int	variable

Examples

Assignments

```
void main() {  
    int j = 0;  
}
```

Assignments

```
void main() {  
    int j = 0;  
}
```

Valid

Assignments

```
void main() {  
    j = 0;  
}
```

Assignments

```
void main() {  
    j = 0;  
}
```

Invalid

Assignments

```
void main() {  
    int main = 0;  
}
```

Assignments

```
void main() {  
    int main = 0;  
}
```

Valid

Assignments

```
void main() {  
    int j = "abc";  
}
```

Assignments

```
void main() {  
    int j = "abc";  
}
```

Invalid

Assignments

```
void main() {  
    int x = 10;  
    int y = x;  
}
```

Assignments

```
void main() {  
    int x = 10;  
    int y = x;  
}
```

Valid

Assignments

```
void main() {  
    int x = 10;  
    string y = x;  
}
```

Assignments

```
void main() {  
    int x = 10;  
    string y = x;  
}
```

Invalid

Binary Operations

```
void main() {  
    int x = 1;  
    int y = 2;  
    int z = x + y;  
}
```

Binary Operations

```
void main() {  
    int x = 1;  
    int y = 2;  
    int z = x + y;  
}
```

Valid

Binary Operations

```
void main() {  
    int x = 1;  
    string y = "A";  
    int z = x < y;  
}
```

Binary Operations

```
void main() {  
    int x = 1;  
    string y = "A";  
    int z = x < y;  
}
```

Invalid

Binary Operations

```
void main() {  
    string x = "A";  
    string y = "B";  
    string z = x * y;  
}
```

Binary Operations

```
void main() {  
    string x = "A";  
    string y = "B";  
    string z = x * y;  
}
```

Invalid

Binary Operations

```
void main() {  
    int x = 7 / 0;  
}
```

Binary Operations

```
void main() {  
    int x = 7 / 0;  
}
```

Invalid

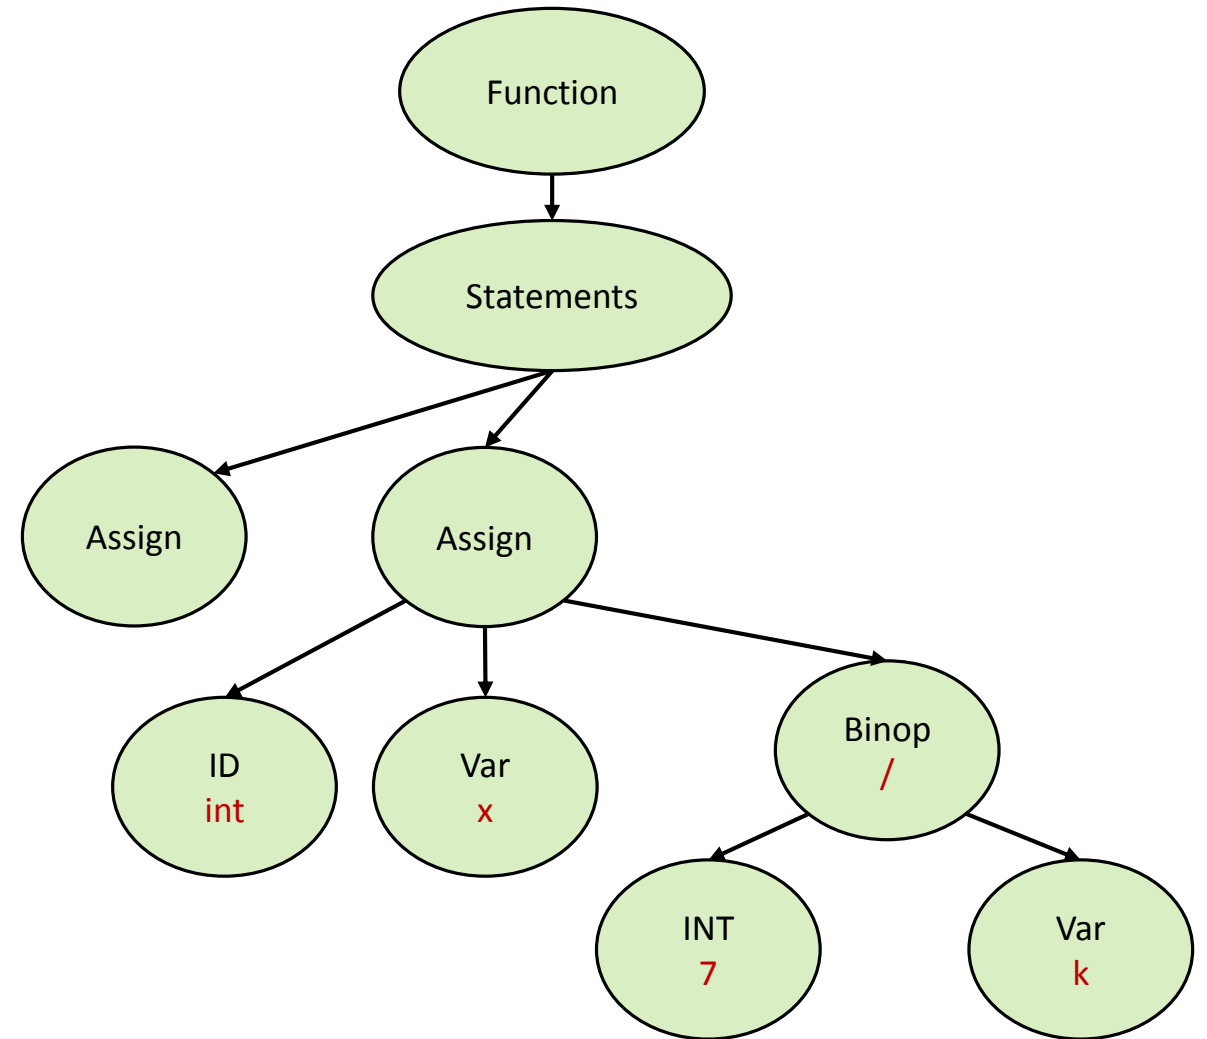

Binary Operations

```
void main() {  
    int k = 0;  
    int x = 7 / k;  
}
```

Binary Operations

```
void main() {  
    int k = 0;  
    int x = 7 / k;  
}
```

Depends

If, While, ...

```
void main() {  
    int x = 1;  
    if (x + 1) {  
        int z = 2;  
    }  
}
```

If, While, ...

```
void main() {  
    int x = 1;  
    if (x + 1) {  
        int z = 2;  
    }  
}
```

Valid

If, While, ...

```
void main() {  
    string x = "A";  
    while (x + "B") {  
        int z = 2;  
    }  
}
```

If, While, ...

```
void main() {  
    string x = "A";  
    while (x + "B") {  
        int z = 2;  
    }  
}
```

Invalid

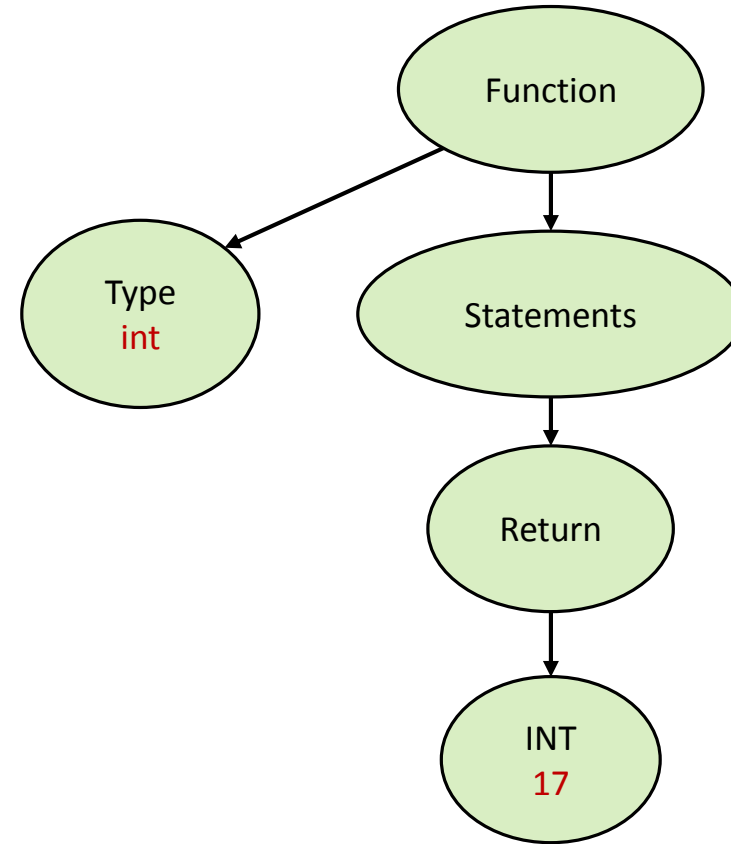

Return Statement

```
int main() {  
    return 17;  
}
```

Return Statement

```
int main() {  
    return 17;  
}
```

Valid

Return Statement

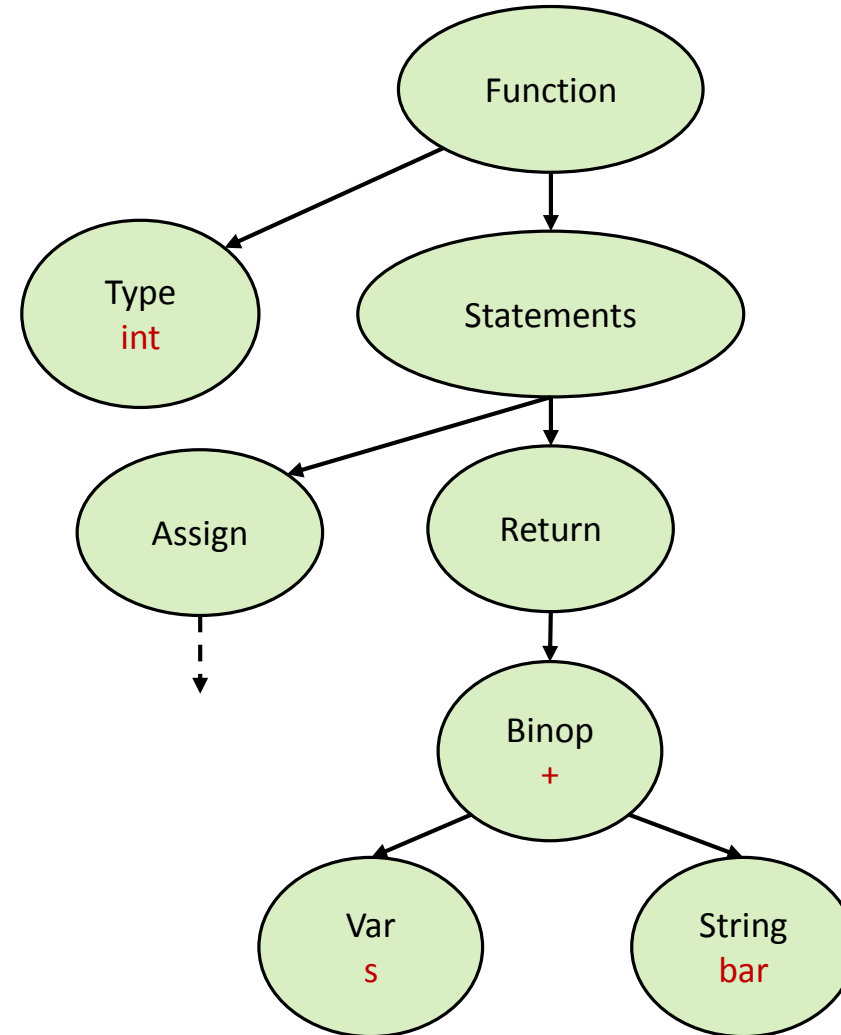

```
int main() {  
    string s = "foo"  
    return s + "bar";  
}
```

Return Statement

```
int main() {  
    string s = "foo"  
    return s + "bar";  
}
```

Invalid

Return Statement

```
void main() {  
    int x = 1;  
    return x + 1;  
}
```

Return Statement

```
void main() {  
    int x = 1;  
    return x + 1;  
}
```

Invalid

Return Statement

```
string g() {  
    return "123";  
}  
int main() {  
    return g() + "4";  
}
```

Return Statement

```
string g() {  
    return "123";  
}  
int main() {  
    return g() + "4";  
}
```

Invalid

Function Calls

```
int g(int x) {  
    return x + 1;  
}  
int main() {  
    return g(42);  
}
```

Function Calls

```
int g(int x) {  
    return x + 1;  
}  
int main() {  
    return g(42);  
}
```

Valid

Function Calls

```
int g(int x) {  
    return x + 1;  
}  
int main() {  
    string z = "..."  
    return g(z);  
}
```

Function Calls

```
int g(int x) {  
    return x + 1;  
}  
int main() {  
    string z = "..."  
    return g(z);  
}
```

Invalid

Function Calls

```
int foo(int k) {  
    int a = k * 10;  
    return foo(a, a);  
}
```

Function Calls

```
int foo(int k) {  
    int a = k * 10;  
    return foo(a, a);  
}
```

Invalid

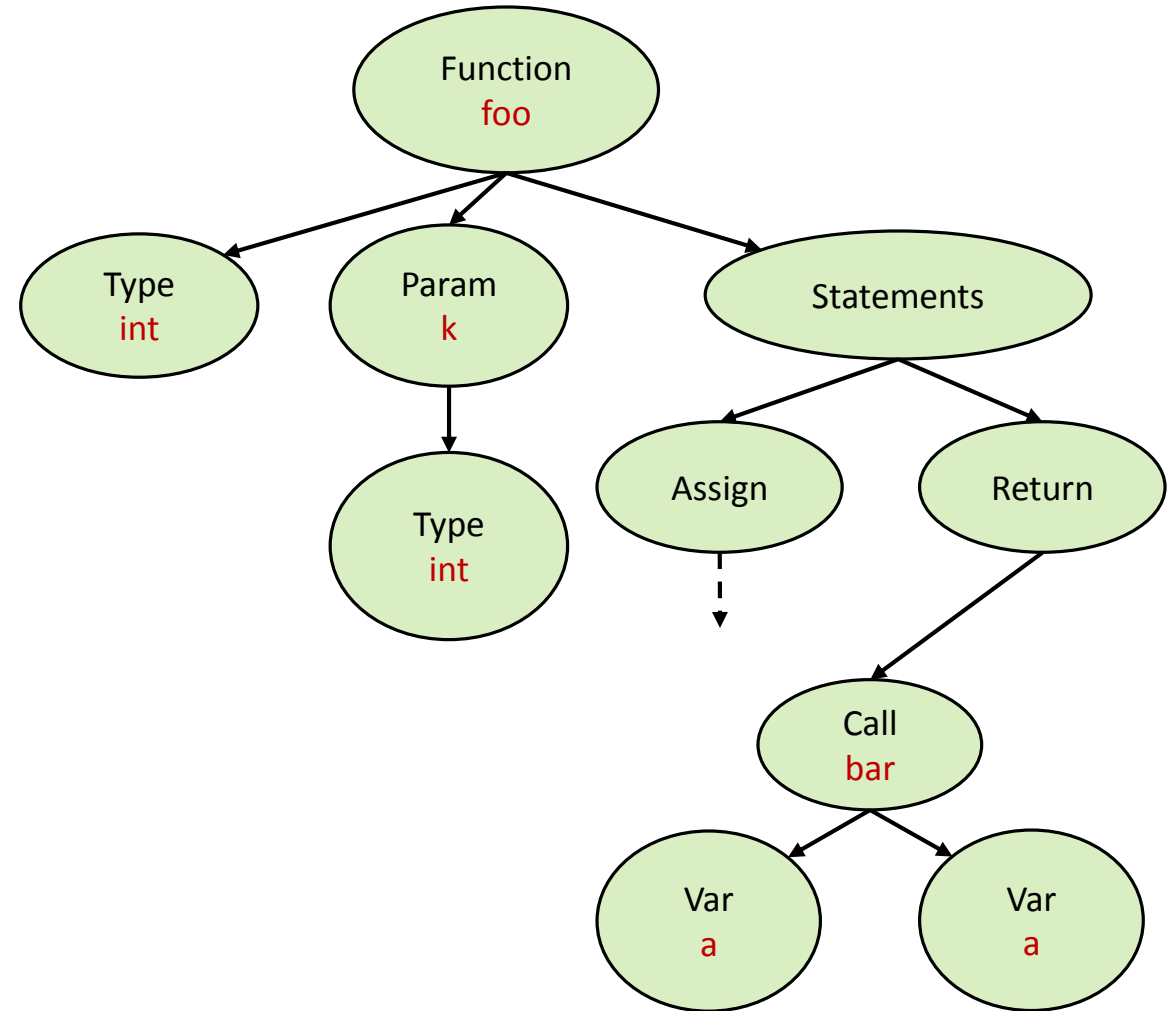

Function Calls

```
int foo(int k) {  
    int a = k * 10;  
    return bar(a, a);  
}
```

Function Calls

```
int foo(int k) {  
    int a = k * 10;  
    return bar(a, a);  
}
```

Invalid

Function Calls

```
int main(int argc,  
          string argv[]) {  
    main(2, argv);  
    return 0;  
}
```

Function Calls

```
int main(int argc,  
          string argv[]){  
    main(2, argv);  
    return 0;  
}
```

Valid

Arrays

```
void foo(void) {  
    int[] arr = new int["z"];  
}
```

Arrays

```
void foo(void) {  
    int[] arr = new int["z"];  
}
```

Invalid

Arrays

```
void foo(int d) {  
    int k = 3;  
    int[] arr = new int[10];  
    arr[k] = 17;  
}
```

Arrays

```
void foo(int d) {  
    int k = 3;  
    int[] arr = new int[10];  
    arr[k] = 17;  
}
```

Valid

Classes

```
class A {  
  int x;  
  int y;  
  void foo(int) { }  
}
```

type of A {
 x : int
 y : int
 foo : void, int

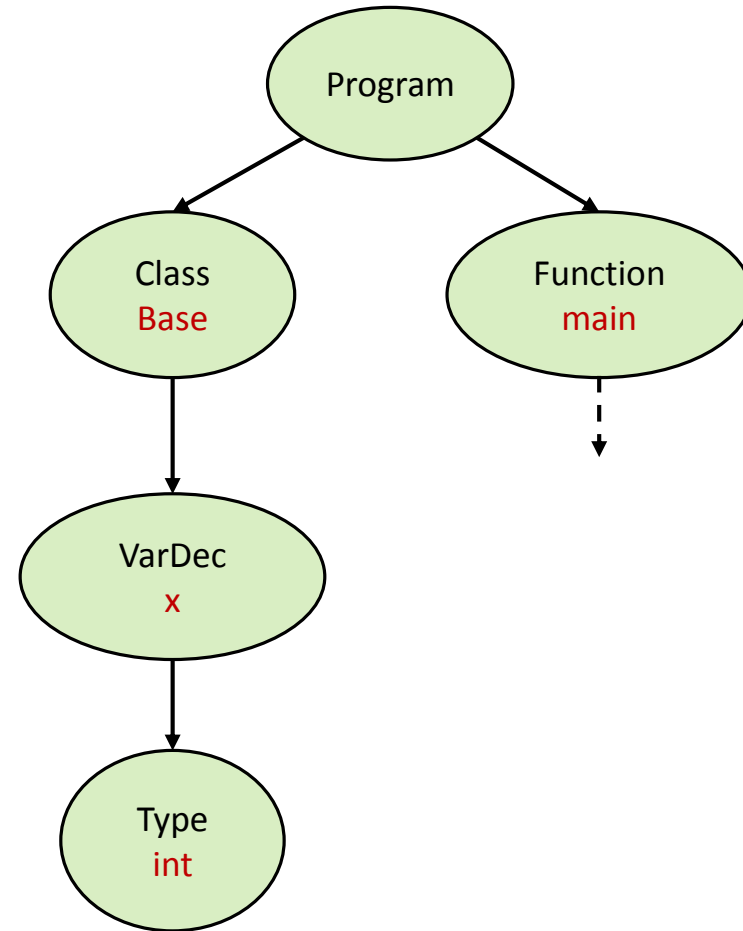

Classes

```

Implementation

The AST is traversed in a top-down manner:

- Each AST node class, has a **visit** API
 - Performs the relevant semantic checks
 - May call the visitors of the node's children
- The traversal starts from the root node

Implementation

```
class ASTExpBinOp {
    public ASTExp left;
    public ASTExp right;
    ...
    public Type visit() {
        Type t1 = left.visit();
        Type t2 = right.visit();
        if (t1 != t2) { // error }
        // check if op is supported w.r.t. t1/t2
        return t1;
    }
}
```

Implementation

```
class ASTStatmentList {  
    public ASTStatement head;  
    public ASTStatmentList tail;  
    ...  
    public Type visit() {  
        if (head)  
            head.visit();  
        if (tail)  
            tail.visit();  
        return null;  
    }  
}
```

Exam Question

We extend the language with automatic type inference:

- Can use **auto** when the declaration has an initial value

Describe the changes required in:

- Lexical analysis
- Syntactic analysis
- Semantic analysis

```
auto i := 8 + 100;  
auto s := "1234";  
class A {}  
A a := new A;  
auto b := a;
```

AST Annotations

AST Annotations

Annotate the AST with information needed for **code generation**:

- Variable/Parameter offsets
- Class layouts
- Type sizes

Runtime Memory Layout

Stack

MIPS: Instructions Set

MIPS has 32 registers:

- t0, ..., t9 (general purpose)
- a0, a1, a2, a3 (arguments)
- v0 (return value)
- sp (stack pointer)
- fp (frame pointer)
- ra (return address)
- ...

MIPS: Instructions Set

Setting registers values:

- li
- move

```
li $t0, 3  
move $t1, $t2
```

MIPS: Instructions Set

Arithmetic instructions operate on registers and constants:

- add, sub, ...

```
add $t2, $t0, $t1  
sub $t3, $t1, 7
```

MIPS: Instructions Set

Read from memory:

- lw

```
lw $t0, 0($t1)
```

```
lw $t0, 12($t1)
```

```
lw $t0, -8($t1)
```

MIPS: Instructions Set

Write to memory:

- `sw`

```
sw $t0,0($t1)
```

```
sw $t0,12($t1)
```

```
sw $t0,-8($t1)
```

Stack

```
int f(int x, int y) {  
    int z = x + y;  
    return z;  
}  
int g() {  
    int x = f(10, 20)  
}
```

Variable Offsets

Machine code **does not** contain names of:

- Local variables
- Parameters

Instead, we use offsets **relatively** to the **stack base pointer**

Variable Offsets

```
int f(int x, int y) {  
    int z = x + y;  
    return z;  
}
```

Variable Offsets

```
int f(int x, int y) {  
    int z = x + y;  
    return z;  
}
```

ID	Type	Kind
f	...	function

Variable Offsets

```
int f(int x, int y) {  
    int z = x + y;  
    return z;  
}
```

ID	Type	Kind
f	...	function

ID	Type	Kind

An arrow points from the 'Type' column of the first table to the 'Type' column of the second table.

Variable Offsets

```
int f(int x, int y) {  
    int z = x + y;  
    return z;  
}
```

ID	Type	Kind
f	...	function

ID	Type	Kind
x	int	variable

An arrow points from the 'Type' column of the first table to the 'Type' column of the second table.

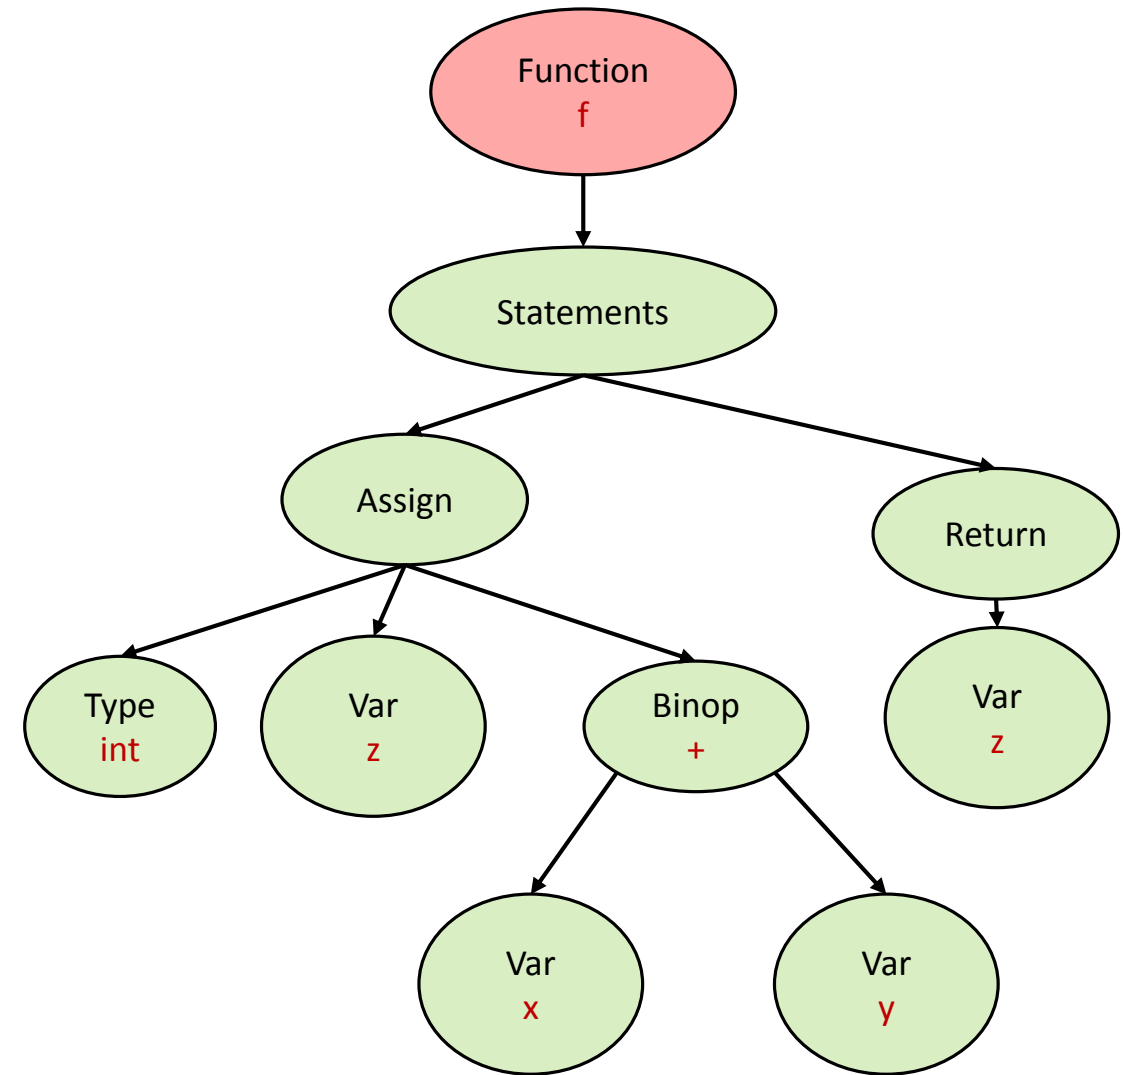

Variable Offsets

```
int f(int x, int y) {  
    int z = x + y;  
    return z;  
}

    }  
}
```

ID	Type	Kind
...

ID	Type	Kind
x	int	variable
y	int	variable

An arrow points from the 'Kind' column of the first table to the 'Kind' column of the second table.

Variable Offsets

```
void f(int x, int y) {  
    if (x > y) {  
        int x = y + 1;  
    }  
}
```

ID	Type	Kind
...

ID	Type	Kind
x	int	variable
y	int	variable

An arrow points from the 'Kind' column of the first table to the 'Kind' column of the second table.

Variable Offsets

```
void f(int x, int y) {  
    if (x > y) {  
        int x = y + 1;  
    }  
}
```

ID	Type	Kind
...

ID	Type	Kind
x	int	variable
y	int	variable

ID	Type	Kind
x	int	variable

Variable Offsets

```
void f(int x, int y) {  
    if (x > y) {  
        int x = y + 1;  
    }  
}
```

ID	Type	Kind
...

ID	Type	Kind
x	int	variable
y	int	variable

ID	Type	Kind
x	int	variable

Variable Offsets

```
void f(int x, int y) {  
    if (x > y) {  
        int x = y + 1;  
    }  
}
```

ID	Type	Kind
...

ID	Type	Kind
x	int	variable
y	int	variable

ID	Type	Kind
x	int	variable

Variable Offsets

```
void f(int x, int y) {  
    if (x > y) {  
        int x = y + 1;  
    }  
}
```

Variable Offsets

```
void f(int x, int y) {  
    if (x > y) {  
        int x = y + 1;  
    }  
}
```

Storing Values

In our language, values can be stored in 32-bit registers:

- type **int** (4 bytes)
- type **string** (4 bytes pointer)
- arrays (4 bytes pointer)
- classes (4 bytes pointer)

Field Offsets

How does an object of this class look in memory?

```
class Point {  
    int x;  
    int y;  
}  
void f(Point p) {  
    p.x = 0xaa;  
    p.y = 0xbb;  
}
```

Field Offsets

How does an object of this class look in memory?

```
class Point {  
    int x;  
    int y;  
}  
void f(Point p) {  
    p.x = 0xaa;  
    p.y = 0xbb;  
}
```

Field Offsets

How does an object of this class look in memory?

```
class Point {  
    int x;  
    int y;  
}  
  
void f(Point p) {  
    p.x = 0xaa;  
    p.y = 0xbb;  
}
```

f:

```
<prologue>  
lw $t0, 8($fp)  
li $t1, 0xaa  
sw $t1, 4($t0)  
li $t1, 0xbb  
sw $t1, 8($t0)  
<epilogue>
```

Field Offsets

How does an object of this class look in memory?

```
class Point {  
    int x;  
    int y;  
}  
  
void f(Point p) {  
    p.x = 0xaa;  
    p.y = 0xbb;  
}
```

```
f:
